

# New Species Recorded By Township

Since Publication of  
The Preliminary Atlas of Reptiles & Amphibians of Vermont  
April, 1995

## New Species Reported

Since the Preliminary Atlas was produced in 1995, we have had over 1,700 contributors add ~25,000 new records. Of these records, ~20,000 are amphibians and ~5,000 are reptiles. Currently, 15 or more species have been reported from 138 Vermont towns. The maps for many of the common species are quickly being filled in. For example, since the Preliminary Atlas, we have added 140 new town records for Green Frogs, and 151 new town records for Eastern Red-backed Salamanders. Although we have made much progress, there are still gaps that need to be filled, particularly for reptiles. We are missing records of Snapping Turtles from 112 Vermont towns, and of Common Gartersnakes from 29 Vermont towns. Your help is still needed to fill in the gaps for all Vermont reptiles and amphibians and continue the progress that has already been made. For more information visit our website at:
