(common in Vermont)**

**Yellow Upper Lip
Olive green head**

**Not as cleanly marked
Yellow stripes lower on body (scale rows
2 and 3)
May or may not have mahogany stripe**

We have been gathering reports of all species of reptiles and amphibians in Vermont since 1994. One of our current target species is the Eastern Ribbonsnake. At first glance, the Eastern Ribbonsnake looks like a very thin Gartersnake with a long and finely-tapered tail. Check for the white lips, reddish head, and mahogany stripe on the lower sides of the Ribbonsnake. Photographs or clear descriptions of these and any other wild reptile or amphibian found would be appreciated. Please include dates, specific locations, and contact information with your reports and send them to:

Vermont Reptile and Amphibian Atlas
642 Smead Road
Salisbury, Vermont 05769
